UPGRADE is the European Journal for the Informatics Professional, published bimonthly at <http://www.upgrade-cepis.org/>

Publisher

UPGRADE monographs are also published in Spanish (full version printed; summary, abstracts and some articles online) by Novática

UPGRADE was created in October 2000 by CEPIS and was first published by Novática and INFORMATIKA/INFORMATIQUE, bimonthly journal of SVI/FSI (Swiss Federation of Professional Informatics Societies, <http://www.svifsociety.ch/>)

UPGRADE is the anchor point for UNEt (UPGRADE European NETwork), the network of CEPIS member societies’ publications, that currently includes the following ones:

- Informatica, journal from the Slovenian CEPIS society SDI
- Informatik-Spektrum, journal published by Springer Verlag on behalf of the CEPIS societies GI, Germany, and SI, Switzerland
- ITNOW, magazine published by Oxford University Press on behalf of the British CEPIS society BCS
- Mondodigitale, digital journal from the Italian CEPIS society AICA
- Novatica, journal from the Spanish CEPIS society ATI
- OCG Journal, journal from the Austrian CEPIS society OCG
- Pliroforiki, journal from the Cyprus CEPIS society CCS
- Tölvumál, journal from the Icelandic CEPIS society ISIP

Editorial Team
Chief Editor: Llorenç Pagés-Casas
Deputy Chief Editor: Francisco-Javier Cantais-Sánchez
Associate Editors: Fiona Fanning, Rafael Fernández-CaIvo

Editorial Board
Prof. Vassile Baltaci, CEPIS President
Prof. Wolffried Stucky, CEPIS Former President
Hans A. Frederik, CEPIS Vice President
Prof. Nello Scarabottolo, CEPIS Honorary Treasurer
Fernando Perea Gómez and Llorenç Pagés-Casas, ATI (Spain)

Can Teamwork Management Help in Software Quality and Process Improvement?

Esperança Amengual-Alcover and Antònia Mas-Pichaco

In modern organizations teamwork is considered a key factor for success in business. A growing interest on team culture has led to a great number of contributions where different teamwork aspects are analyzed as drivers for teamwork practices improvement. Software development process is a team activity. Consequently, success in software organizations depends largely on the performance of software teams. In this article, firstly we study the teamwork key factors for success and quality in software development projects. Secondly, we present a teamwork assessment model for software teams.

Keywords: Software Process Improvement, Software Quality, Teamwork.

1 The Importance of Teamwork in Software Development Projects

Software engineering has long been recognized as a human activity which is managed through a system of processes and tools. The interaction and dependencies between the processes, the technology used to support them and the people implementing these processes represents the socio-technical environment of a software development project. The integration of the three elements of the "people, process and technology triangle" is usually considered by managers the basis for successful IT projects (see Figure 1).

In software companies technology is usually considered crucial to the effectiveness of their processes and, consequently, technology is normally used to support software development processes (e.g., CASE tools). However, the use of tools can only produce significant gains in software development projects if they are used in an appropriate manner which usually means the implementation of a strategy, a procedure or a well-defined process. Therefore, it seems that we give more importance to the second critical element, the process. In fact, process orientation is the current tendency in Software Engineering literature. Different process improvement models have emerged in recent years and they are becoming, step by step, a reference framework for software development organizations.

In this article we will focus our attention on the third critical element of the triangle: the people. Only people are able to make good use of the other two elements in a balanced way. In our particular triangle, the people dimension is the basis, the most important element (see Figure 2).

Multi-disciplinary research explores how cooperative and human aspects affect software development. A reasonable number of works consider human aspects a key factor in software engineering projects. In [1], its authors highlight that "it appears the human aspects of software development are more important that the technological aspects for better performance". According to [2] the majority of problems in software projects "are due to people problems, not technical ones". Consequently, bearing in mind that IT projects are usually a team activity, the good performance of teams should be considered essential for the success in these kind of projects.

2 Teamwork Key Factors

A large number of research projects address fundamental issues about software teamwork. Different authors expose in their studies the elements that should be taken into consideration to efficiently work in a team.

Larson and Lafasto’s research on high-performance teams [3] determines the eight dimensions of an effectively
functioning team. Those eight dimensions include:
1. A clear and elevating goal.
2. Results-driven structure.
3. Competent team members.
4. Collaborative climate.
5. Unified commitment.
7. External support and recognition.
8. Principled leadership.

Other relevant contributions to the analysis of team performance in organizations have been Belbin’s and Constantine’s role theories identifying the different roles in a team [4][5].

Steve McConnell, in his book *Rapid Development* [6], specifies the characteristics of a hyperproductive team:
- Shared, elevating vision or goal.
- Sense of team identity.
- Results-driven structure.
- Competent team members.
- Commitment to the team.
- Mutual trust.
- Interdependence among team members.
- Effective communication, a sense of autonomy.
- Sense of empowerment.
- Small team size.
- High level of enjoyment.

Lakhanpal has proved that team cohesiveness contributes more to productivity than the capabilities or the experience of the project members [7].

According to Barry Boehm, motivation has a larger impact on productivity and quality than any other factor [8]. Despite the number of studies emphasizing the importance of teamwork in software projects, it appears that there is not a consensus among authors to identify the characteristics that define teamwork.

With the goal of assessing teamwork, it has been necessary to precisely define the set of teamwork factors to be considered in order to measure and improve teamwork. As a result of the revision of the existent literature we have identified the following four factors as the "teamwork key factors" (see Figure 3):
- Management.
- Composition.
- Communication.
- Motivation.

### 3 Teamwork in Process Maturity Models

Software process improvement initiatives based on international standards for process assessment and improvement, such as CMM (Capability Maturity Model) [9] or SPICE (Software Process Improvement Capability dEtermination) [10][11][12][13][14], are focused on the assessment and improvement of the software lifecycle processes and do not explicitly consider essential aspects of teamwork.

After developing the Capability Maturity Model as a descriptive model of the characteristics of an organization at a particular level of software process maturity [15], the Software Engineering Institute (SEI) has developed the Team Software ProcessSM (TSPSM), a prescriptive model for software development teams. As it is defined in the SEI technical report which relates the TSP to the CMM [16], "TSP is a high-maturity process for project teams. It contains an adaptable set of processes, procedures, guidelines, and tools for project teams to use in the production of high-quality software on time and on budget". In [17] some results from projects that have adopted the TSP are provided. The results show that TSP teams are delivering essentially defect-free software on schedule, while improving productivity.

Regarding applying the other standard, SPICE [18][19], our particular experience in leading software process improvement initiatives has brought us to consider teamwork an important aspect in any process improvement initiative.

### 4. Teamwork Assessment in Software Projects

With the interest of focusing on teamwork aspects in software projects, it has been necessary to precisely define the set of teamwork factors to be considered in order to measure and improve teamwork. As a result of the revision of the existent literature we have identified the following four factors as the "teamwork key factors" (see Figure 3):
- Management.
- Composition.
- Communication.
- Motivation.

![Figure 1: The "People, Process and Technology Triangle"](image1)

![Figure 2: The People Dimension as the Basis of Successful IT Projects.](image2)
our future software process improvement initiatives, we have developed a teamwork assessment model for software projects. This model comprises a reference model, a questionnaire and a measurement scale.

4.1 A Teamwork Reference Model
The teamwork reference model presented in this article details the factors which should be considered in order to assess teamwork. Each factor of this reference model provides information in the form of:

- a factor identification;
- a factor name;
- a description which details the different aspects for the factor; and
- a set of teamwork best practices which identify the tasks needed to accomplish the purpose of the factor.

The following four tables show the detail for each one of the four teamwork key factors (see Table 1 to 4).

4.2 A Teamwork Assessment Questionnaire
At a conceptual level, our intention is to measure teamwork in software projects from two different perspectives: the project manager and the team members. This measurement goal has been refined, moving from a conceptual level to an operational level, by posing questions which compose a teamwork assessment questionnaire. Each question addresses a particular aspect of a teamwork factor.

The questionnaire comprises 55 questions distributed in two groups:

- A group of questions for all the members of the team. The purpose of this second group of questions is to collect the different responses from all the members of the team. These responses address the four "teamwork key factors".

At a quantitative level, we have defined a measurement framework for the assessment of the teamwork aspects. Within this framework we have established four possible responses to each question: never, sometimes, often and very often.

Finally, the performance of each teamwork factor is measured using the rating scale proposed by SPICE where four ordinal points are understood in terms of a percentage (see Table 5).

5. Conclusions and further Work
It is essential that Software Engineering considers the importance of the people dimension in software projects. The best technological solution together with a good process definition does not guarantee the success of a project if this project is not implemented by a team which performs the process in an efficient manner. Therefore, teamwork measurement should be additionally considered in any software process improvement initiative.

After analyzing the state of the art in teamwork in software projects, in this paper we have identified the four "teamwork key factors". These factors compose a teamwork reference model that can be used as a framework for teamwork assessment and improvement.

Our future work is to analyze the usefulness and applicability of this teamwork assessment model. We are currently working in a new SPICE-based software process improvement programme in small and medium companies of the Balearic Islands. The teamwork assessment model is expected to be applied in parallel with process assessment.
